BOOK PROSPECTUS · OCTOBER 2026

Using Data to Drive Business Performance

Databases and Management Information Systems

Courseware that teaches business students to turn data into decisions they can explain and defend: a textbook, an interactive reader, guided builds, labs, auto-graded quizzes and a semester project, built to run as one course.

Nimrod Dvir, PhD
Massry School of Business
University at Albany, SUNY

Prepared for Cengage. Shared privately.

Version 1 · Summer 2026	Tested with a small group of students.
Version 2 · Fall 2026	In use with 500 students this fall. Explore the live courseware ↗

THE PROPOSITION

What is this book about?

Courseware for the applied business database and MIS data-management course that connects the way data is organized, queried and managed to the decisions an organization makes.

In this course, students learn how to understand data, organize it, store it in a relational database, ask questions of it in SQL, check the answers, analyze and visualize the results in Power BI, and make a decision. AI appears throughout as an assistant whose work students learn to check.

The course arc

Data → Tables → Relationships → Queries → Analytics → Decisions

The chapter components

The proposed edition has **16 chapters in five parts**. Each chapter is built from the same set of eight components, and a semester project runs across the book in three graded checkpoints, ending in a capstone decision memo.

- **Introduction.** The business question and the chapter objectives.
- **Core concepts.** The main chapter, in numbered sections with worked examples.
- **Terms Treasury.** The key terms, defined in context.
- **Review questions.** Recall and reflection.
- **Reading Assessment Test.** An auto-graded quiz, tied to the book's own databases.
- **Let's Build.** Guided, hands-on practice on the running case.
- **Interactive lab.** Independent practice on a second case, with hints and verification tasks.
- **Key takeaways.** A summary and a bridge to the next chapter.

Instructor materials

The courseware also includes materials for instructors:

Review questions · Terms Treasury · Answer keys · Automatic quiz grading · Rubrics · Slides · Lesson plans · Instructor dashboard

Who it is for

Primary course	The applied business database or MIS data-management course: modeling, normalization, SQL through window functions, administration, warehousing and business intelligence, taught through business cases.
Business core	The required data or information systems course for accounting, finance, marketing, management and operations students, who need to query, check and present data. A shorter route through the same chapters serves it.
Adjacent courses	Accounting information systems, business analytics foundations, and bridge courses in IS master's programs.

THE AUTHOR'S STARTING POINT

Why and how it was built

I wrote this book because, after seven years of teaching this course to more than 4,000 students with materials from the leading publishers, I still could not find a textbook that matched my needs.

Available textbooks were either too technical, too thin on hands-on practice, or missing content the course needed. As cloud databases, analytics and visualization tools, and AI entered the workplace, the gap grew. I often assigned two books and filled the remaining gaps myself.

I also saw a focused opportunity. In one published study, 85% of 61 business schools required at least one information systems course in the business core, and in our review no textbook appeared at more than 3 of the 31 schools. The research below documents both.

So I built the courseware myself, chapter by chapter, over a year of work with colleagues, and taught it: a test with a small group of students in summer 2026, and 500 students in fall 2026.

Four principles that shaped it

Seven years in the classroom	I have taught the introductory MIS course at the University at Albany for seven years, to more than 4,000 students. The chapter labs and quizzes were developed and refined across those semesters.
More than ten years of editing	Before I became a professor, I spent more than ten years as a magazine editor. That shaped the writing: clear, visual and organized around the reader, at a level business undergraduates can follow.
The research	I reviewed the main textbooks used in these courses chapter by chapter, examined what universities across the country teach, and compared 63 syllabi and course documents from 31 institutions. The outline draws directly on that work. See the research below.
Full control and quick iteration	Because I built the platform, tools, examples and AI guidance can change each semester instead of each edition. After the summer test and the current deployment with 500 students, I collect live feedback from students and revise continuously.

Ready now

- The full textbook, live as an interactive digital edition and in use at the University at Albany
- A Let's Build, an interactive lab and an auto-graded quiz in every chapter
- Student accounts, automatic quiz grading and an instructor dashboard
- Two running cases: the Grading Database and PetVax
- An Access route: Access labs and an Access appendix

Planned for the next edition

- The research-based 16-chapter outline below
- In-browser PostgreSQL (PGlite) practice workspaces inside the reader
- A planned MySQL route, to be tested on the shared cases
- Automated feedback on SQL and lab answers (prototype in testing)
- A small retail business, proposed as an alternative case for evaluation

Why 14 weeks? A 16-week semester usually has about 14 teaching weeks once holidays, the midterm and the final are removed. The outline offers two selectable course routes through those weeks rather than a fixed schedule of one chapter per week; final pacing is to be agreed in review.

THE RESEARCH BEHIND THE COURSEWARE

Market research

How the market research was done

What we reviewed	Federal degree statistics (NCES, and IPEDS completions through Data USA), peer-reviewed studies of business and IS curricula, AACSB accreditation data, U.S. Bureau of Labor Statistics projections, the World Economic Forum's employer survey, and a published analysis of U.S. data analyst job postings. Our own syllabus research, below, adds the textbook and AI-policy findings.
How	We retained published figures with their source years, separated degree counts from course and program evidence, and combined two of them into illustrative reach proxies. Each proxy is shown with its assumptions and would need publisher validation.
What we looked for	How many students take a course like this each year, which programs require it, what employers ask for, and whether any textbook already dominates the course.

Finding 1: a large, required course

375,418
DEGREES, 2021–22

Business bachelor's degrees awarded in the U.S.

About one in five of all bachelor's degrees.

Source: NCES [1]

85%
OF 61 BUSINESS SCHOOLS

Require at least one information systems course in the business core

52 of 61 schools studied (89% of them AACSB-accredited); 3% required two IS courses.

Source: Fustos, Morris and Haga [2]

12,092
DEGREES IN 2024

Management information systems degrees awarded

Up 3.4% over the prior year. Counts all award levels reported, not only bachelor's degrees.

Source: Data USA [3]

87.3%
OF 394 IS PROGRAMS

Offer a data and information management course

344 of 394 U.S. undergraduate IS programs in business schools (data collected in 2013).

Source: Hwang, Ma and Wang [4]

---

285 of 535
AACSB SCHOOLS

U.S. AACSB-accredited schools that offer an information systems program

A further 109 offer an undergraduate business analytics program (Table 2).

Source: Zheng et al. [5]

82%
OF 74 IS MASTER'S PROGRAMS

Require a data, information and content management course

61 of 74 programs at AACSB schools: a graduate audience for the same material.

Source: Yang [6]

81,835
DEGREES IN 2024

Accounting degrees awarded, an adjacent audience

Accounting information systems courses cover much of the same ground. All award levels reported.

Source: Data USA [7]

1,098
INSTITUTIONS

AACSB-accredited institutions worldwide

In 71 countries and territories, as of September 2026.

Source: AACSB [8]

Award levels: the Data USA counts (MIS and accounting) are IPEDS completions across all award levels reported, not bachelor's degrees alone. The NCES figure counts bachelor's degrees only.

Two routes, one book

A commonality we found: **most business schools in the published studies require an information systems course of every business student, and most IS programs offer a database course.** The proposed routes address these two settings; fit must be reviewed against each course's outcomes and available teaching time. In round numbers:

About 320,000
ILLUSTRATIVE REACH PROXY

Business students who reach a required IS course

375,418 business bachelor's degrees (2021–22) × the 85% of business schools that require at least one IS course (2017 study).

Source: Our estimate from [1], [2]

About 10,600
ILLUSTRATIVE REACH PROXY

MIS students in programs with a database course

12,092 MIS degrees across all award levels (2024) × the 87.3% of IS programs that offer the course (2015 study).

Source: Our estimate from [3], [4]

Planning assumptions: each proxy multiplies a degree count by a historical, program-level share from a different source year. They are not enrollment-weighted course-seat estimates, and the MIS count covers all award levels. The two audiences overlap and must not be added together. Publisher enrollment and adoption data are needed to estimate addressable annual seats.

Finding 2: a varied textbook landscape

60
TITLES

Textbooks named in the syllabi we reviewed

No title appeared at more than 3 of the 31 schools reviewed. Instructor-made materials also appear. This describes the reviewed collection, not national market share.

Source: Syllabus research, below

2021
LAST REVISION

Cengage's applied business-database title

Concepts of Database Management, 10th edition, is built on Access 2019 and SQL Server 2019. It has served the course well, and the tools and topics have moved on since.

Source: Cengage [13]

Adoption fit

Adoption fit is described qualitatively: which courses could use the courseware, what they need, and what a review should confirm. No revenue, seat or institution forecasts are made.

Segment	Likely need	Validation focus	Adoption opportunity
Primary Applied business database / MIS data management	Relational thinking, SQL, design, implementation, and business interpretation in one coherent learning path.	Course outcomes, required database engine, incumbent materials, and switching criteria.	Full courseware adoption with readings, guided practice, independent labs, assessment, and instructor resources.
Business core data / IS course	Data meaning, information systems, queries, reporting, and a bounded project.	Which chapters fit the existing course and how much SQL and design it expects.	The business-core route through the same chapters.
Accounting information systems	Data meaning, controls, reporting and integrity.	Which modules fit the existing course.	Modular adoption or a companion pathway, subject to course fit.
Business analytics foundations	Data preparation, trustworthy SQL measures, and reporting.	Required design depth, analytical prerequisites, and reporting platform.	A selected chapter and lab route that supplies the database foundation for analytics.

MAIN CONCLUSION

The evidence supports exploring two defined course routes: the applied business database / MIS course, which this book leads with, and the required business-core data / IS course. Their outcomes, tools and switching criteria should be validated separately.

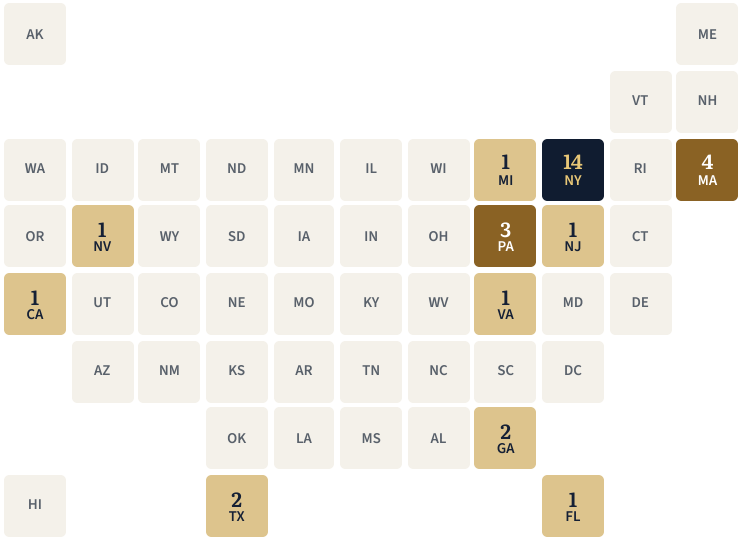

SYLLABUS RESEARCH

Curriculum evidence

Why and how the syllabus research was done

Why	To check the outline against what courses across the country actually teach: which topics, which tools, which textbooks, how they assess, and what they say about AI.
What we collected	63 syllabi and course documents: syllabi, catalog descriptions and course schedules for database and business-data courses, mostly undergraduate, from the public websites of 31 universities. Retrieved October 1, 2026.
Why 63 documents but 31 institutions	Many institutions contribute more than one course, and some courses have more than one document. The 63 documents describe 54 distinct courses at 31 institutions. Of the 54 courses, 19 are business-database or business-core data courses, the closest match to this book.
How we read them	Archived documents and the earlier audits were reviewed for topics, platforms, textbooks, assessment and AI policies. Each set of findings retains its own sample and denominator. [S1]

The 31 institutions analyzed

14 **New York.** 8 SUNY campuses, plus Baruch, Brooklyn College, City Tech, NYU Stern, Syracuse and Hofstra.

12 **East Coast.** Rutgers, Temple, Penn State, Lafayette, Boston University, Northeastern, both UMass campuses, George Mason, Georgia, Georgia Tech and FIU.

5 **National.** UT Austin, UT Dallas, Michigan-Dearborn, San Jose State and UNLV.

D direct business-database course BC business-core data course. Unbadged courses are technical, follow-on or graduate comparisons. Together, the badged courses are the 19 closest comparators.

What the courses teach, based on our analysis

Share of the 13 course descriptions in the earlier catalogue benchmark that mention each topic. These are lower bounds from course descriptions, not topic frequencies across the 63-document archive; a topic not documented in a description may still be taught.

Which databases they use

Platform evidence is role-coded: **practical use** (the text assigns or demonstrates work with the tool), a **named option**, or a **software-list mention** only. The chart counts any of the three, as a share of all 54 course families and of the 19 direct and business-core families. Families can name more than one platform, and 20 of the 54 name none explicitly.

Any mention (practical use, option or listed). Among the 19 closest comparators, Access has the largest footprint (9 of 19); across all 54 families, MySQL leads (15 of 54). Practical use alone is shown in the table.

Platform	Practical use	Option	Listed only	Course families	Institutions	Direct / business-core
MySQL	10	3	2	15	11	6
Microsoft Access	10	0	2	12	8	9
Oracle	4	2	2	8	7	2
Microsoft SQL Server	3	3	0	6	4	2
PostgreSQL	1	4	0	5	4	0
MongoDB	4	0	0	4	3	1
Google BigQuery	3	0	0	3	2	1
Tableau	3	0	0	3	2	1

Platform	Practical use	Option	Listed only	Course families	Institutions	Direct / business-core
SQLite	0	1	1	2	2	0

How they assess, and what they say about AI

Assessment

Staged and team projects recur across the documents reviewed, for example at SUNY Oswego, Baruch, Boston University, Rutgers and UT Dallas, usually alongside exams. The documents do not support a typical weighting across the archive.

AI

Twelve of the 18 primary offerings dated 2024–2026 include inline student AI-assistance provisions. Five of those 18 document no student AI rule; one refers to a linked policy whose contents were unavailable.

How did the findings shape the book?

Editorial interpretation: how each documented finding informed the proposed outline.

Design and data modeling

Named in all 13 catalogue benchmark descriptions.

→

A two-chapter design block:

requirements to ER diagrams, then normalization.

Ch 7 Ch 8

SQL and hands-on building

Each appears explicitly in 10 of the 13 benchmark course descriptions (77%).

→

Three SQL chapters,

a build-and-test chapter, and a Let's Build in every chapter.

Ch 5 Ch 6 Ch 9 Ch 10

Multiple platforms

Access has the largest documented footprint in the Direct / Business-core subset; MySQL leads across all reviewed course families. The archive also includes Oracle, SQL Server, PostgreSQL and other systems.

→

Teach SQL in the PostgreSQL dialect,

with a portable core and explicit dialect differences; keep the existing Access route, add a planned MySQL route to be tested on the same cases, and propose Supabase as the hosted PostgreSQL environment.

App A | App B | App C

BI and analytics

Named in 4 of 13 benchmark descriptions (31%).

→

Analytics, reporting and Power BI chapters

close the loop from query to decision.

Ch 12 | Ch 13 | Ch 14

AI and cloud

AI / ML appears in 1 of 13 benchmark descriptions; cloud / APIs / ETL in none. This does not measure their prevalence across the full archive.

→

An AI Check from Chapter 5 on,

and a dedicated chapter on big data, data warehouses and AI.

Every chapter | Ch 15

Staged projects

Staged, multi-phase projects recur across the documents reviewed.

→

One staged project through the semester,

with graded checkpoints and an individual demonstration at the end.

Studio A | Ch 11 | Ch 16

Method: 63 archived documents, 31 institutions, 54 grouped course families; topic percentages use a separate 13-course catalogue benchmark, and the AI-policy review uses 18 recent primary offerings. The searchable register below retains source dates and course roles.

Selected institution evidence

Institution	Course	Evidence date / level	Documented emphasis	Implication for this proposal
Rutgers	33:136:470	Fall 2026	SQL early, design/normalization, operational topics and a staged project.	Supports use-before-design and a cumulative project.
Baruch	CIS3400	Fall 2026 draft	Business requirements, ER modeling, normalization, SQL and an Access application.	Preserve application thinking and a substantive Access companion.
NYU Stern	TECH-UB26	Spring 2026	BigQuery SQL, cleaning, joins, aggregation, subqueries and window queries; ER concepts.	Supports browser/cloud SQL and an analytics-facing route.
Temple	MIS2502	Spring 2026	SQL, schemas, normalization, Python/JSON, data movement and analytics.	Connect query work to preparation and interpretation.
Georgia Tech	MGT4058	Fall 2026	Design, relational mapping, normalization, SQL and BI/warehouse concepts.	Protect the database core while connecting to reporting.
Boston University	MET-CS669	Spring 2026 · graduate	Design, SQL, operations and a project developed across six iterations.	Staged project structure is useful; graduate technical depth remains optional.
UT Dallas	ITSS4300	Spring 2026	SQL, modeling, normal forms, CTEs, windows, BI and security.	Provide advanced SQL extensions without removing essential design.
University of Georgia	MIST4610	Summer 2020	Modeling, MySQL, query work and visual answers to business questions.	Supports a query-to-communication chain; platform evidence is historical.

Search filters document records, including grouped supplements. The aggregate denominator remains 54 course families.

SKILLS AND WORK

Labor, employer and industry research

What we researched

A 2026 analysis by 365 Data Science of 1,000 Indeed USA data analyst postings (855 relevant), U.S. Bureau of Labor Statistics projections for 2025–35, and the World Economic Forum employer survey.

What employers ask for

We looked at what employers ask for in the skills this book teaches.

52.9%
OF JOB POSTINGS

U.S. data analyst job postings that ask for SQL

Of 855 relevant postings in a vendor analysis of 1,000 Indeed USA listings. Python appears in 31.2%, Power BI in 29.0% and Tableau in 26.2%.

Source: 365 Data Science [9]

+35%
GROWTH, 2025 TO 2035

Projected growth in data scientist jobs

Against 3% for all occupations. Median pay: $120,230 a year (May 2025).

Source: U.S. Bureau of Labor Statistics [10]

+9%
GROWTH, 2025 TO 2035

Projected growth in database architect jobs

Median pay: $139,500 a year (May 2025).

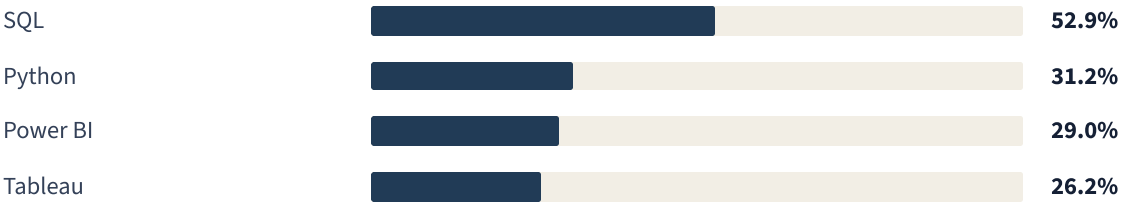

Source: U.S. Bureau of Labor Statistics [11]

About two-thirds
OF EMPLOYERS WORLDWIDE

Plan to hire for AI skills

AI and big data are the fastest-growing skills employers report.

Source: World Economic Forum [12]

Share of 855 U.S. data analyst job postings that list each skill.

Evidence	Finding	Courseware implication
BLS: data scientists, 2025–35	**35% projected growth**, compared with 3% for all occupations; about **24,800 openings annually**. [L1]	Connect data preparation and queries to interpretation, communication, and decisions.
BLS: database architects / administrators, 2025–35	Architects: **9%** growth. Administrators: **0%**. Combined: about **7,300 openings annually**. [L2]	Retain modeling, quality, permissions, backup, and system judgment alongside analytics.
WEF: Future of Jobs Report 2025	Survey of **1,000+ employers**, representing **14 million+ workers** across **55 economies**; roughly **7 in 10** identify analytical thinking as essential. [L3]	Require students to explain a result, test its reliability, and justify an action.
WEF: skills outlook to 2030	AI and big data lead the skills employers expect to grow fastest. [L3]	Integrate responsible AI use, verification, data provenance, and limits across the learning experience.

MAIN CONCLUSION

> SQL, reporting and judgment belong together. Students need to produce a result, establish that it is reliable, and communicate what an organization should do with it.

Job-posting shares describe this sample of 855 postings, not all U.S. hiring. BLS growth projections (the change in employment, 2025–35) and annual openings are separate measures: openings include replacement hiring, so they can be substantial even where growth is flat. Global employer expectations (WEF) are distinct from U.S. job-posting requirements.

THE COMPARISON AND DIFFERENTIATION

Textbook research

How the textbook research was done

We reviewed the leading textbooks used in the courses we studied and compared their tables of contents, structure, tools and audience, chapter by chapter.

The textbooks reviewed

Database Systems: Design, Implementation, and Management

Coronel and Morris · Cengage, 15th edition (©2027)

CHAPTERS	16 in 6 parts
SQL STARTS	Chapter 4, before ER modeling
TOOLS	Auto-graded database labs in MindTap
BEST FIT	IS and MIS majors who need depth

Concepts of Database Management

Friedrichsen et al. · Cengage, 10th edition (2021)

CHAPTERS	9
SQL STARTS	Chapters 2 to 3
TOOLS	Access 2019, SQL Server 2019; MindTap and SAM
BEST FIT	Applied business courses

Database Concepts

Kroenke, Auer, Vandenberg and Yoder · Pearson, 10th edition

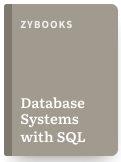

CHAPTERS	7, with more online
SQL STARTS	Chapter 3
TOOLS	Access, MySQL 8.0, Azure; running projects
BEST FIT	Short, Access-first courses

Modern Database Management

Hoffer, Topi, Venkataraman and Bala · Pearson, 14th edition

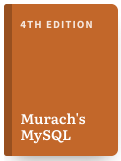

CHAPTERS	13
SQL STARTS	Chapter 5
TOOLS	Oracle, SQL Server, MySQL; an analytics chapter and State of AI sections
BEST FIT	Managerial MIS courses

Database Systems with SQL and zyLabs

Winsberg et al. · zyBooks

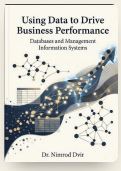

CHAPTERS	12 interactive chapters
SQL STARTS	Early
TOOLS	Built-in SQL sandbox; MySQL and MySQL Workbench chapters
BEST FIT	Practice-heavy courses

Murach's MySQL

Murach · 4th edition

CHAPTERS	Query-first workbook
SQL STARTS	Chapter 1
TOOLS	MySQL Workbench, AWS
BEST FIT	SQL skills courses

Using Data to Drive Business Performance

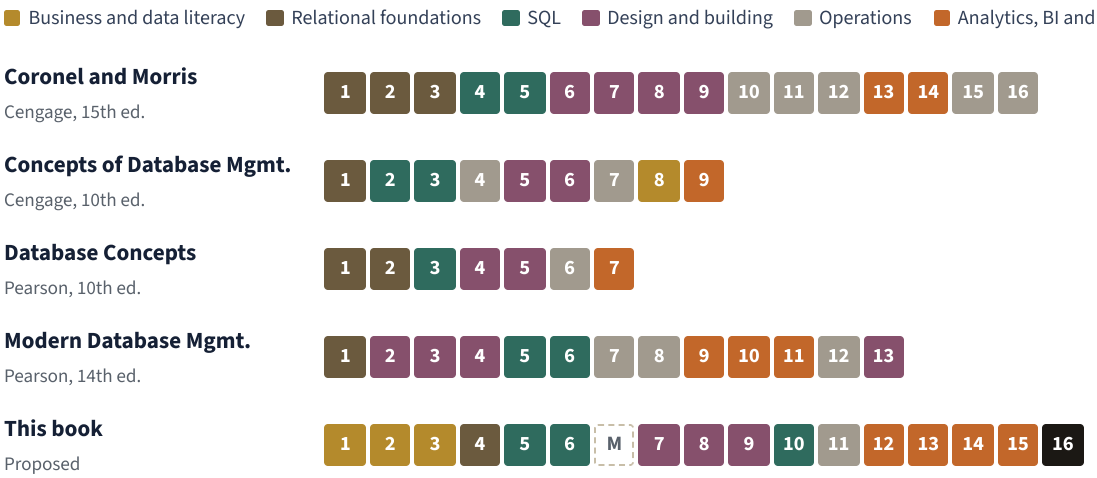

Dvir · proposed next edition

CHAPTERS	16 in 5 parts
SQL STARTS	Chapter 5, after data literacy
TOOLS	PostgreSQL and Supabase; MySQL and Access routes; Power BI
BEST FIT	Business-core and MIS courses

Publisher pages: Coronel and Morris 15e; Concepts of Database Management 10e; Database Concepts 10e; Modern Database Management 14e.

Chapter by chapter, in order

We coded each chapter of the four main textbooks by its main topic to see which topics the books have in common and in what order they teach them. Each square is one chapter. The last row is the proposed outline of this book.

M marks the midterm Integration Studio. Topic classification is ours, from publisher tables of contents.

What it tells us: the four compared sequences share relational foundations, SQL and design. The proposed edition keeps that core and extends its opening business / data-literacy sequence into dedicated analysis, reporting, Power BI and capstone work.

What the leading books do well, and this book keeps

- **The relational core:** keys, relationships, ER modeling and normalization to third normal form
- **Early, hands-on SQL,** as in Coronel 15th edition, Kroenke and zyBooks
- **Administration, transactions and security** as a full chapter
- **Warehousing, star schemas and NoSQL** as the bridge to analytics

Where they stop, and this book continues

- **The four compared chapter sequences open with database foundations rather than a three-chapter business-performance, data-literacy and information-organization sequence.** This book does, in Chapters 1 to 3.
- **A dedicated Power BI studio is a proposed distinction in this comparison,** alongside analytics, visual reporting and a capstone decision memo. Current competing texts already cover aspects of BI and analytics.
- **Competing texts cover AI as a topic;** Modern Database Management, for example, adds State of AI sections. This design makes checking AI-assisted work a recurring practice, with an AI Check from Chapter 5 on.
- **Courses and books support different database products.** This proposal keeps PostgreSQL central, keeps the existing Access route, and plans a MySQL route to be tested on the same cases.

Inspect the four detailed book outlines

Database Systems: Design, Implementation, & Management Cengage

Coronel and Morris · 15th edition; 14th retained as historical baseline [P2]

The existing course proposition

Broad database design, implementation and systems instruction. Its digital resources already include SQL practice; the current edition places SQL before formal design.

The proposed distinction

The proposed book narrows the primary audience to applied business learners and makes validation, reporting and a decision memo part of one repeated workflow.

Chapter-level sequence

1. Database systems
2. Data models
3. Relational foundations
4. SQL introduction
5. Advanced SQL
6. ER modeling
7. Advanced modeling
8. Normalization
9. Database design
10. Transactions and concurrency
11. Query performance
12. Distributed databases
13. BI and warehouses
14. Big data and NoSQL
15. Connectivity and web technologies
16. Administration and security

The 15th-edition sequence is paraphrased from the earlier contents audit; the official current listing was checked for edition and scope. The uploaded 14th edition instead puts modeling/normalization before SQL. Do not use its sequence to describe the 15th.

Concepts of Database Management Cengage

Friedrichsen, Ruffolo, Monk, Starks, Pratt and Last · 10th edition [P3]

The existing course proposition

A concise applied introduction with QBE/algebra, SQL, normalization, relationships, operations, careers and trends. Includes cases and Access training in MindTap.

The proposed distinction

The nearest portfolio conversation: a business-performance framing with verified analytical SQL, a proposed browser-to-hosted PostgreSQL path, BI work and an integrated decision deliverable. This is a potential position, not an agreed replacement.

Chapter-level sequence

1. Introduction to database management
2. Relational model, QBE and algebra
3. Relational SQL
4. Advanced relational topics
5. Normalization
6. Relationships in database design
7. DBMS processes and services
8. Database careers
9. Industry trends

The official nine-module sequence is paraphrased. Appendices address a complete design example, SQL, FAQs, MySQL and requirements analysis.

Database Concepts Pearson

Kroenke, Auer, Vandenberg and Yoder · 10th edition; uploaded PDF is 9th [P4]

The existing course proposition

A compact hands-on database text with multiple running examples/projects, software flexibility, cloud coverage and MySQL extensions.

The proposed distinction

The proposed distinction is the sustained business-measure-to-decision chain and explicit evidence requirements, rather than the mere existence of business cases, cloud topics or early SQL.

Chapter-level sequence

1. Getting started
2. Relational foundations
3. SQL
4. ER data models
5. Database design
6. Administration and cloud
7. BI, warehouses and big data

Seven-part chapter sequence paraphrased using publisher/reference-edition audit. The older uploaded PDF supports historical analysis and must not be labeled the current edition.

Modern Database Management Pearson

Hoffer, Topi, Venkataraman and Bala · 14th edition [P5]

The existing course proposition

A comprehensive organizational database text. Current coverage extends from data to analysis, with an analytics chapter, notes on cloud-based solutions and new State of AI sections.

The proposed distinction

A serious comparison: the proposal must demonstrate a more bounded business-course workload and a coherent guided-to-independent learning experience; it cannot claim competitors omit analytics or AI.

Chapter-level sequence

1. Database environment and development
2. Organizational data modeling
3. Enhanced ER models
4. Logical design and relational foundations
5. SQL introduction
6. Advanced SQL
7. Databases in applications
8. Physical design and infrastructure
9. Big data
10. Integrated platforms and warehouses
11. Data-to-insight analytics
12. Administration and data quality
13. Object-oriented modeling

Current official chapter-level sequence paraphrased. Advanced normal forms and notation appear in appendices.

A CLEAR COURSEWARE PROPOSITION

How it is different

This book differentiates itself by teaching business students to use data to make decisions. It differs from the main textbooks by:

1. **Starting with the business.** Chapter 1 opens with performance, goals and KPIs, before any database theory.
2. **Teaching data before databases.** Data types, measurement scales and organizing information come first.
3. **Using a database before designing one.** Students query a supplied database in Chapters 4 to 6, then design their own.
4. **Ending with the decision.** Analytics, dashboards and a full Power BI chapter lead to a decision memo.
5. **One SQL dialect, flexible tools.** SQL is taught in the PostgreSQL dialect, with a portable core and explicit dialect differences. The Access route is in use today; a MySQL route is planned and will be tested on the same cases.
6. **Industry tools students can keep.** Supabase hosts the PostgreSQL project database; Power BI is the main reporting studio, with Tableau as an alternate route. Classroom accounts, licensing and access need an agreed support plan.

7 **Making AI a habit.** From Chapter 5 on, an AI Check asks students to accept, revise or reject AI-assisted work and to take responsibility for the result.

8 **Practice in every chapter.** A Let's Build, an interactive lab and an auto-graded quiz, all on the book's own cases.

9 **Developed in class.** Version 1 was tested in summer 2026; version 2 is in use with 500 students in fall 2026.

STRUCTURE, SEQUENCE AND LEARNING DESIGN

The proposed 16-chapter edition

A proposed edition, built on the research above. It sets out what the next edition would contain; it does not change the current live book.

The book at a glance

A preface, **16 chapters in five parts**, an unnumbered Midterm Integration Studio, an unnumbered closing chapter on careers, and seven appendices. Each chapter below shows its guiding question, its Let's Build and its lab; open **Sections and research connection** for the section list and the research each chapter is based on.

PREF

Preface: Why This Book, and How It Works

Why it was written and how to use it.

Sections

P.1 Why I Wrote This Book

P.2 How This Book Is Different

P.3 How a Chapter Works

P.4 The Tools, and Why They Were Chosen

P.5 Two Routes Through the Book

P.6 How AI Is Used in This Book

PART I · CHAPTERS 1 TO 3

From Data to Decisions

Main goal: Connect data to business performance, classify data correctly and organize information.

1 From Data to Business Performance

How does a business turn everyday activity into better results?

Let's Build: Trace one KPI back to the records that produce it.

Interactive lab: A KPI audit of a small business: three KPIs, the data each needs, and who decides with it.

Sections and research connection

1.1 What a Business Is and How It Creates Value

1.2 Business Performance, Goals and KPIs

1.3 From Data to Wisdom: The DIKW Pyramid

1.4 Information Behavior: How People Seek and Use Information

1.5 Information Systems and Information Technology

1.6 The R.E.A.D. Framework: Recognize, Extract, Analyze, Decide

1.7 AI in the Data-to-Decision Chain

1.8 The Running Cases and the Semester Project

> **Based on:** None of the four compared texts opens with business performance and KPIs. Business-systems framing appears in Buffalo MGS 351, Syracuse IST 195 and UNLV MIS 766.

2 Understanding Data

What kind of data is this, and what can I legitimately do with it?

Let's Build: Profile a dataset column by column: type, scale and allowed operations.

Interactive lab: Data Type Detective: classify and repair a messy business file, then draw one valid insight per column type.

Sections and research connection

2.1	Data and Information
2.2	Digital and Analog Data; Bits, Bytes and Tokens
2.3	Data Types: Numbers, Text, Dates, Booleans and Files
2.4	Qualitative and Quantitative Data
2.5	Levels of Measurement: Nominal, Ordinal, Interval, Ratio
2.6	Structured, Semi-Structured and Unstructured Data: CSV and JSON
2.7	What Makes a Good Table
2.8	Data Quality
2.9	From Data to Insight: What Each Type Allows

> **Based on:** The compared outlines do not give data literacy and measurement scales their own opening chapter. Data preparation appears in NYU TECH-UB 26 and Temple MIS 2502.

3 Organizing Data and Information

How do we make data findable, reusable and trustworthy?

Let's Build: A data dictionary and a folder-and-tag scheme for the running case.

Interactive lab: Reorganize and document a shared-drive mess.

Sections and research connection

3.1	Why Organization Matters
3.2	Files, Folders, Naming and Versions
3.3	Hierarchies, Tags and Facets
3.4	Metadata, with YAML as an Example
3.5	Taxonomies and Controlled Vocabularies
3.6	Data Dictionaries
3.7	Spreadsheets as Tables, and Where They Break
3.8	From Organized Files to Databases

> **Based on:** Added by design from information science, so students see why databases exist before they build one. Not a standalone topic in the syllabi reviewed.

Databases and SQL

Main goal: Read a relational database and answer business questions with SQL.

4 Databases and the Relational Model

Why do organizations keep data in related tables instead of files?

Let's Build: Explore a supplied case database in Supabase Studio and trace a relationship.

Interactive lab: Read an unfamiliar schema and predict the answers to five business questions before querying.

Sections and research connection

4.1 What a Database Is and What a DBMS Does

4.2 Local and Cloud Databases: SQLite, PostgreSQL, Supabase, MySQL, Access

4.3 Tables, Rows, Columns and Data Types

4.4 Primary, Foreign and Composite Keys

4.5 Relationships: One-to-One, One-to-Many, Many-to-Many

4.6 Schemas, Integrity Rules and Constraints

4.7 Database Objects: Tables, Queries, Views, Forms and Reports

> **Based on:** Design and data modeling are named in all 13 catalogue benchmark descriptions; relational foundations are documented in Baruch CIS 3400, George Mason MIS 310 and SUNY Canton CITA 215.

5 SQL Foundations

How do I ask one table a precise question?

Let's Build: Answer ten business questions on the running case.

Interactive lab: The same skills on the second case, with an AI Check.

Sections and research connection

5.1	SELECT and FROM
5.2	Filtering with WHERE, LIKE, IN and BETWEEN
5.3	Sorting, DISTINCT and LIMIT
5.4	Working with NULL and Dates
5.5	Aggregate Functions
5.6	Creating Tables and Inserting Data
5.7	Safe UPDATE and DELETE
5.8	AI Check: Accept, Revise or Reject an AI-Written Query

Based on: SQL appears in 10 of 13 catalogue benchmark descriptions (77%) and in 52.9% of the 855 analyst postings. Early SQL in Rutgers 33:136:470, Northeastern CS 3200 and UT Dallas ITSS 4300.

6 SQL for Business Analysis

How do I combine tables into trustworthy business measures?

Let's Build: Build a small KPI report from joined tables.

Interactive lab: Find and fix a double-counted measure.

Sections and research connection

6.1 INNER and LEFT Joins

6.2 Joining Three or More Tables

6.3 GROUP BY and HAVING

6.4 CASE Expressions for Business Categories

6.5 Calculated Measures: Rates, Averages and Shares

6.6 Grain and the Double-Count Problem

6.7 Checking Results by Hand

> **Based on:** Joins and aggregation are where business reports most often go wrong. Taught at Rutgers, Temple, UT Austin and UT Dallas.

MID

Integration Studio A (midterm)

An unnumbered review week between Parts II and III.

Cumulative review of Chapters 1 to 6, a practice exam, and **Project Checkpoint 1**: proposal and data plan.

Research connection

> **Based on:** Staged, multi-phase projects recur across the course documents reviewed, so the project has graded checkpoints through the semester.

Designing and Running Databases

Main goal: Design, normalize, build, test and secure a database of their own.

7 Database Design: From Requirements to ER Diagrams

How do business rules become a database design?

Let's Build: Draw the ERD for the running case from its business rules.

Interactive lab: Design an ERD for a new business process.

Sections and research connection

7.1	The Systems Development Life Cycle
7.2	Waterfall and Agile
7.3	Requirements and Business Rules
7.4	Entities, Attributes and Relationships
7.5	Cardinality, Optionality and Crow's Foot Notation
7.6	Associative Entities and Many-to-Many Relationships
7.7	Drawing ERDs with Lucidchart, diagrams.net or Mermaid

> **Based on:** Design and data modeling are named in all 13 catalogue benchmark descriptions. ER modeling comes before normalization, as in Coronel and Morris, Kroenke and Hoffer.

8 Normalization

How do we design out errors before they happen?

Let's Build: Normalize a flat spreadsheet to third normal form.

Interactive lab: Normalize a real business form and prove no data was lost.

Sections and research connection

8.1 Update, Insert and Delete Anomalies

8.2 Functional Dependencies

8.3 First Normal Form

8.4 Second Normal Form

8.5 Third Normal Form

8.6 Decomposing and Rejoining Tables

8.7 When to Denormalize

Based on: Normalization is core in each of the four compared texts and is documented in Baruch, Rutgers, George Mason, Georgia Tech and SUNY Farmingdale BCS 260.

9 Building and Testing a Database

How do we turn a design into a working, trustworthy database?

Let's Build: Build and load the running-case database in Supabase.

Interactive lab: Build the lab case from its ERD and run an integrity test suite.

Sections and research connection

9.1	Data Definition Language: CREATE, ALTER, DROP
9.2	Constraints
9.3	Loading Data from CSV
9.4	Staging and Cleaning
9.5	Integrity Tests
9.6	Data Entry Workflows and Forms

Based on: Hands-on building appears in 10 of 13 catalogue benchmark descriptions (77%). Implementation projects at Rutgers, Baruch and Boston University MET CS 669.

10 Advanced SQL

How do analysts write queries that are reusable and easy to check?

Let's Build: A reusable analysis layer of views and CTEs.

Interactive lab: A monthly performance report with rankings and period-over-period change.

Sections and research connection

10.1 Subqueries

10.2 Common Table Expressions

10.3 Views

10.4 Conditional Aggregation

10.5 Window Functions

10.6 Set Operations

10.7 Functions and Triggers

10.8 Reading a Query Plan with EXPLAIN

Based on: Analytical SQL with CTEs and window functions appears in current syllabi at NYU Stern and UT Dallas.

11 Database Administration, Security and Reliability

How do we keep business data safe, correct and available?

Let's Build: Add roles, row-level security and an audit trigger to the running case.

Interactive lab: A security and recovery plan for the lab case. Project Checkpoint 2: working database.

Sections and research connection

11.1	Roles, Users and Least Privilege
11.2	Row-Level Security
11.3	Transactions and ACID
11.4	Concurrency
11.5	Backup and Recovery
11.6	Indexes and Performance
11.7	Governance, Privacy and Compliance
11.8	Audit Trails

> **Based on:** Administration, security or transactions appear in 6 of 13 catalogue benchmark descriptions (46%), including Rutgers, UT Austin, George Mason and SUNY Canton.

From Data to Insight

Main goal: Analyze results, visualize them, report in Power BI and work with warehouses and AI.

12 Business Analytics and Decision-Making

What does the data actually tell us, and how sure are we?

Let's Build: A SQL analysis that answers one management question.

Interactive lab: An analytical memo for the lab case.

Sections and research connection

12.1 Four Kinds of Analytics

12.2 Framing an Analytical Question

12.3 Distributions, Segments and Fair Comparisons

12.4 Correlation and Causation

12.5 Uncertainty

12.6 From Measure to Decision

12.7 The Decision Memo

> **Based on:** Closes the loop from query to decision with a decision memo. Business analysis tasks appear in Temple MIS 2502 and Georgia MIST 4610.

13 Reporting and Data Visualization

How do we show results so people decide well?

Let's Build: Redesign a misleading dashboard.

Interactive lab: A one-page dashboard specification.

Sections and research connection

13.1 Reports and Dashboards

13.2 Choosing the Right Chart

13.3 Honest and Misleading Visuals

13.4 Accessible Design

13.5 Designing for Decision-Makers

13.6 The Tableau Route

> **Based on:** Only 4 of 13 catalogue benchmark descriptions (31%) include BI or analytics. Visualization appears in Georgia MIST 4610 and UT Austin MIS 325.

14 Power BI

How do we turn a database into an interactive business report?

Let's Build: A Power BI report on the running case.

Interactive lab: A Power BI report on the lab case, validated against SQL.

Sections and research connection

14.1 Connecting to a Database

14.2 Shaping Data with Power Query

14.3 The Data Model and Relationships

14.4 Measures, Calculated Columns and DAX Basics

14.5 Building an Interactive Report

14.6 Validating Every Number Against SQL

> **Based on:** Power BI is listed in 29% of the 855 analyst postings and is not documented in any of the course families reviewed, so it is added by design.

15 Big Data, Data Warehouses and AI

How do organizations work with data at scale, and where does AI fit?

Let's Build: A small star schema from the running case.

Interactive lab: Evaluate three AI answers about the lab data: accept, revise or reject.

Sections and research connection

15.1 OLTP and OLAP

15.2 Warehouses, Marts, Lakes and Lakehouses

15.3 Star Schemas: Facts and Dimensions

15.4 ETL, ELT, APIs and JSON

15.5 Big Data and NoSQL

15.6 AI and Data: Text-to-SQL, Embeddings and Retrieval

15.7 Verifying AI Output

Based on: The 13-course catalogue benchmark names AI in one description and cloud computing in none. Warehousing appears in Baruch CIS 4400 and graduate AI topics in UT Dallas BUAN 6V99; these inform extensions, not universal requirements.

Putting It to Work

Main goal: Deliver a capstone decision package and plan a path into data careers.

16 Capstone: From Data to Decisions

Can you take a real business problem all the way to a defensible decision?

Project Checkpoint 3: the final project, with a working database, analysis, dashboard and decision memo, and an individual demonstration.

Sections and research connection

16.1 Scoping the Problem and the KPI

16.2 From Data Dictionary to ERD

16.3 Building the Database

16.4 Analysis and a Validated Dashboard

16.5 The Decision Memo

16.6 Demonstration and Reflection

> **Based on:** Staged projects at Rutgers, Boston University and Georgia. The individual demonstration responds to the uneven AI policies documented in the syllabi.

END

Closing: Where Data Can Take You

Where do these skills lead?

Sections and research connection

C.1	The Data-to-Decision Journey on One Page
C.2	Careers in Data: Analyst, BI Analyst, Database Administrator, Data Architect, Data Engineer
C.3	Data Skills in Every Business Major
C.4	Building a Portfolio

> **Based on:** The labor-market figures in the market research: data scientist jobs growing 35% and database architect jobs 9% through 2035.

Appendices

A — **Supabase and the In-Book SQL Editor**
Setting up a Supabase project, using Supabase Studio, and (planned) running PostgreSQL inside the reader.

B — **MySQL Route**
Planned: schemas, seed data and solutions for every SQL chapter, to be tested on the shared cases, for courses built on MySQL.

C — **Microsoft Access Route**
Tables, relationships, visual queries, forms and reports on the same cases. An Access appendix and Access labs exist today.

D — **SQL Reference and Dialect Guide**
PostgreSQL, MySQL, SQL Server and SQLite side by side.

E — **Diagramming with Lucidchart**
ER diagrams in Lucidchart, with diagrams.net and Mermaid as free alternatives.

F — **Tableau Route**
The visualization chapter's activities in Tableau.

G

Aa

Terms Treasury

The glossary of every key term in the book.

How students progress

1	**Understand the data**	Chapters 1 to 3: what data is, how it measures performance, and how to organize it.
2	**Use a database**	Chapters 4 to 6: query a supplied database before designing one.
3	**Build one**	Chapters 7 to 11: design, normalize, build and secure their own database.
4	**Decide and defend**	Chapters 12 to 16: turn results into dashboards and a decision memo they can explain and defend.

Two ways to use the book

Both routes reflect the syllabus research: business-core courses emphasize data use, design and reporting, while MIS courses need the full database sequence. Both are selectable; final pacing is to be agreed in review.

Business-core data course	Chapters 1 to 8, then 12 to 14.
MIS database course	Chapters 1 and 4 to 16, with Chapters 2 and 3 as assigned reading.

ONE SQL FOUNDATION

Technology and tools

The syllabus platform audit distinguishes documented practical use, a named option, and a software-list mention. Counts use 54 selected course families and overlap across tools. Official documentation then informs the proposed PGlite, Supabase, and Power BI pathway. [S2] [T1] [T2] [T3]

Practical use means the reviewed text assigns or demonstrates work with the tool; an option does not establish that a student selected it. Twenty course families lack sufficiently explicit practical / listed platform evidence. No adoption of Supabase or PGlite was established in this archive.

Main conclusion

MySQL and Access have substantial documented footprints in the reviewed courses. Keep meaningful compatibility routes while using one principal SQL foundation. The choice of PostgreSQL is a design recommendation, rather than the dominant platform in this sample.

The proposed technology pathway

Recommendation: PostgreSQL as the SQL foundation, PGlite for immediate practice in the browser, and Supabase for the hosted project. Power BI provides the main reporting studio; Tableau is an alternate route. Lucidchart supports modeling, with a supported alternative. Access keeps its existing route; a MySQL route is planned and will be tested on the shared cases.

Layer	Recommended role	Condition for adoption
SQL	Main skill and reasoning language.	Portable core examples with PostgreSQL-specific syntax labeled.
PGlite	Immediate embedded practice.	Planned. Implement and test persistence, reset, accessibility and known-answer checks.
Supabase	Hosted project and operational controls.	Classroom onboarding, export/restore, permission tests and a supported exit route; no guaranteed free service claim.
Power BI	Principal BI studio in Chapter 14.	Windows authoring access or a supported institutional virtual lab.
Tableau	Equivalent alternate visualization studio.	Same data, measures and rubric; avoid two required BI tools in the standard route.
Lucidchart	Diagramming example.	Provide a supported alternative; no presumed free-tier entitlement.
Access / MySQL	Compatibility routes. Access is a route in use (labs and an appendix); MySQL is a planned route.	Test the MySQL route on the shared cases, with equivalent core examples and instructor setup; not every student must learn both.

PGlite executes locally in the browser; Supabase is hosted PostgreSQL. Export / import must be taught explicitly. Power BI Desktop requires Windows or an institutional virtual lab. “Browser-first SQL practice with a hosted project” accurately describes the intended path; integration, access, licensing, and maintenance still need implementation decisions.

Companions and appendices

Platform setup, alternatives, reference, and instructor resources

Companion	Purpose
PostgreSQL / PGlite / Supabase	Setup, workspace reset/persistence, portable SQL, explicit transfer, exports, restore and access tests.

Companion	Purpose
MySQL / MySQL Workbench	A planned alternate route, to be tested with matching data, query results and dialect differences. An appendix-length syntax list alone is insufficient.
Microsoft Access	In use today. Tables, relationships, visual queries, forms, reports and an equivalent small application.
Lucidchart and alternatives	Crow's Foot modeling, exports and review; diagrams.net/ERDPlus or Mermaid alternatives avoid a mandatory subscription.
Power BI and Tableau	A complete Power BI studio plus an equivalent Tableau reporting route; Mac access planning is explicit.
SQL reference and advanced database topics	Portable core syntax, dialect flags, triggers/procedures, deeper windows and normal forms.
Capstone, reviews and instructor resources	Milestones, tests, rubrics, solution files, slides, question banks and course-route maps.

GUIDED BUILDING AND INDEPENDENT TRANSFER

Running projects

Running cases

Every Let's Build uses one guided case and every lab uses a second case, so students learn a skill once and then transfer it. The Grading Database and PetVax are the existing running cases. A small retail business is proposed as an alternative for evaluation; it is not a completed third case.

GUIDED CASE · IN USE

Grading Database

Courses, assignments and grades offer a familiar setting, although policy complexity still needs careful scoping.

What to test: Keep as the guided case with a small, stable schema.

LAB CASE · IN USE

PetVax veterinary clinic

Customers, pets, visits, services and payments give real relationships and operating KPIs.

What to test: Whether students relate to the setting.

PROPOSED ALTERNATIVE · FOR EVALUATION

Small retail business

Orders, products, customers and revenue suit the analytics, Power BI and star-schema chapters.

What to test: Whether the extra entities overload an introductory lab.

PRACTICE IN EVERY CHAPTER

Learning and assessment

Each chapter uses the components listed in the overview. Here is what each one assesses.

Assessment that makes reasoning visible

Students predict and define before execution, test keys and totals during execution, and interpret the result afterward. Reading checks, guided practice, independent labs, cumulative reviews, and the final project serve distinct purposes.

Assessment	Purpose	Proposed evidence
Reading assessment tests	Check readiness and conceptual distinctions.	Short scenario, output-prediction and misconception items; separate formative feedback from graded evidence.
Let's Build	Guided skill development.	Worked reasoning, expected results and checkpoints.
Interactive chapter labs	Independent transfer.	SQL, numeric answers, diagrams, files and short interpretations, appropriate to the chapter.
AI Check	Practice judging AI-assisted work, from Chapter 5 on.	Accept, revise or reject an AI-written query or answer, with a short written reason.
Project checkpoints	Stage the semester project.	Proposal and data plan at the Midterm Integration Studio, a working database in Chapter 11, and the final project in Chapter 16.
Cumulative tests / reviews	Integrate ideas across chapters.	Unfamiliar schema or changed business rule; explain and repair.

Assessment	Purpose	Proposed evidence
Final project	Demonstrate a complete usable solution.	Rebuildable database, validation log, report, decision memo and individual demonstration.

Assessment principle

Use known-result SQL and integrity tests where they fit; use human review for modeling, explanations, and business judgment. Evaluate unfamiliar variations and require a short individual explanation. Automated feedback on SQL and lab answers is a prototype in testing, and AI-assisted feedback is a development option that needs validation.

One problem. Three checkpoints. A defensible recommendation.

01 **Question and requirements.** A scoped business problem, stakeholder, measure, source plan and acceptance criteria. Start in the opening chapters.

02 **Design and working data.** An ERD, normalization rationale, implemented schema, synthetic data, import/reject log and integrity checks.

03 **Evidence and action.** Tested SQL, reconciled reporting, essential access/recovery controls, a decision memo and an individual change task.

Proposed rubric	Weight
Problem framing and requirements	10%
Data model and normalization rationale	20%
Implementation and data quality	20%
SQL correctness and verification	20%
Reporting and business interpretation	15%
Reproducibility, controls and individual explanation	15%

Rubric weights are a proposal for faculty review, not a change to the live course. A compact submission includes schema.sql, seed data, queries.sql, an ERD, validation evidence, README and a short decision memo. A live link alone is insufficient because its data may change after submission.

THE OPPORTUNITY FOR CENGAGE

Advantages of this courseware

The courseware already works in the classroom, and each chapter ties reading, guided practice, a lab and an auto-graded quiz to the same business cases.

Ready asset	Live, in its second version, and used by 500 students this semester. The textbook, labs, quizzes and instructor materials exist today, so the work ahead is revision and review, not a first draft.
Two course routes	One book serves the applied MIS database course and the business-core data course through two selectable routes, from the same chapters.
Portfolio fit	No title appeared at more than 3 of the 31 schools reviewed, and Cengage's applied title in this space, *Concepts of Database Management*, was last revised in 2021. This book can serve the applied course with current SQL, analytics and AI, and complement deeper texts such as *Database Systems* rather than compete with them.
Known partner	I already work with Cengage as a member of its Intro Computing Thought Leadership Board.
Additional opportunities	Adjacent courses such as accounting information systems and business analytics foundations, custom editions, and an Access route (with a planned MySQL route) that let current adopters keep tools they already teach.

FOR OUR NEXT CONVERSATION

Open questions

Three areas to decide together.

1	Publishing arrangement and portfolio positioning	The form of the publishing relationship, and where the book sits among Cengage's current titles.
2	Development scope	The tools and routes to support, the running cases, platform fit, and the sample unit reviewers see first.
3	Responsibilities, review milestones and manuscript submission	Who does what, what reviewers receive and when, and the manuscript submission timeline.

Detailed agenda

The questions raised in the earlier brief and prospectus, grouped under the three areas

1. Publishing arrangement and portfolio positioning

- **Positioning:** a new applied title, a successor to *Concepts of Database Management*, or a companion to *Database Systems* (Coronel and Morris)?
- **Primary market:** the applied MIS database course first, the business-core course, or both routes from one book?
- **Complement, not compete:** where the outline should complement Cengage's current titles, and where it should not compete.

2. Development scope, tools, cases and sample unit

- **Tools and access:** which routes to support fully (Access, MySQL, PostgreSQL), and how students reach Power BI.
- **Platform fit:** how the chapter package (reading assessments, labs, SQL practice) maps to MindTap, and whether a live SQL environment such as Supabase or in-browser PostgreSQL can connect to it.
- **Running cases:** keep the Grading Database and PetVax, or evaluate a commercial case such as retail orders and revenue?
- **Sample unit:** which complete unit (reading, guided build, lab, solution and rubric) reviewers should see first.

3. Responsibilities, review milestones and manuscript submission

- **Review package:** what reviewers receive (this outline, sample chapters, a lab, reader access), how many reviewers, and with what criteria.
- **Responsibilities:** who maintains the platform, the cases and the instructor materials during development.
- **Timeline:** the key review dates and the manuscript submission plan.

SUGGESTED NEXT STEPS

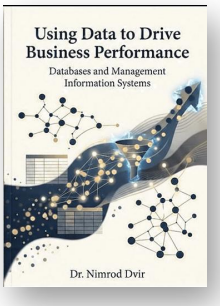

Let’s cement the next steps.

I would like to formalize our publishing relationship and agree on the development scope and manuscript submission timeline.

01 **Formalize the publishing relationship.** Agree on the publishing arrangement and the book's place in the portfolio.

02 **Agree on the development scope.** Settle the audience, tools, cases and the sample unit.

03 **Set the milestones.** Agree on responsibilities, review milestones and the manuscript submission timeline.

Research archive, textbook, labor and platform references

[S1]

Author's syllabus archive and manifest

63 public course documents (syllabi, catalog descriptions and schedules) from 31 institutions, collected from institutional websites on October 1, 2026. Mixed course levels and dates; the original source of each document is linked in the course register. Archive available on request.

[S2]

Author's database-platform evidence model

October 17, 2026 audit of the same archive. Role-coded platform evidence (practical use, option, listed) for 54 selected course families; counts recalculated October 25, 2026. Available on request.

[S4]

Author's textbook adoption and contents audit

October 10, 2026 report: 60 named books and course texts in the archive, with school-level mentions. Historical mentions, not market shares. Available on request.

[P2]

Cengage: Database Systems, 15th edition ↗

Coronel and Morris. Official current listing checked October 25, 2026: 16 chapters in six parts, with Introduction to SQL (Chapter 4) and Advanced SQL (Chapter 5) before ER modeling; auto-graded database labs in MindTap.

[P3]

Cengage: Concepts of Database Management, 10th edition ↗

Friedrichsen, Ruffolo, Monk, Starks, Pratt and Last. Official publisher search results provide the nine-module outline and Access practice description.

[P4]

Pearson: Database Concepts, 10th edition ↗

Kroenke, Auer, Vandenberg and Yoder. Current publisher educator page; the uploaded PDF is the older ninth edition, not the tenth.

[P5]

Pearson: Modern Database Management, 14th edition ↗

Hoffer, Topi, Venkataraman and Bala. Official contents and description checked October 25, 2026: 13 chapters, SQL from Chapter 5, an analytics chapter and new State of AI sections.

[L1]

U.S. Bureau of Labor Statistics: Data Scientists ↗

Current Occupational Outlook Handbook read October 25, 2026. Projects 35% employment growth, 2025-2035; all occupations 3%.

[L2]

U.S. Bureau of Labor Statistics: Database Administrators and Architects ↗

Current Occupational Outlook Handbook read October 25, 2026. Architects 9%; administrators 0%; combined 4%, 2025-2035. Rounded percentages.

[L3]

World Economic Forum: Future of Jobs Report 2025 ↗

Employer expectations for 2025-2030: analytical thinking essential to about seven in ten responding companies; AI and big data lead skills expected to grow. Global employer survey, not U.S. hiring requirements.

[T1]

PGlite: What is PGlite? ↗

Official documentation: embedded PostgreSQL compiled to WebAssembly; runs in the browser, with optional local persistence. It is not itself a hosted cloud database.

[T2]

Supabase: Database overview ↗

Official documentation: each project provides a PostgreSQL database. Hosted operations, accounts, permissions and product limits require a separate teaching plan.

[T3]

Microsoft: Get Power BI Desktop ↗

Current installation documentation, checked October 25, 2026. Windows desktop authoring creates an access requirement for Mac users.
